Built quiet. Run hot.

AI companies still burn money like humans.

- raise capital → hire humans → wait for revenue
- $1.2M seed · 60% goes to payroll
- AI tools exist — coordinated systems don't
- build velocity capped by human sprint cycles

our answer: agents that build and earn simultaneously.

Same project.
½ price. ¼ time.

SOFTWARE COMPANY

- 8-hour workday · sick days · holidays
- senior dev: $120k – $180k / yr
- meetings · context switching · onboarding
- 60 – 70% of budget → payroll
- 6-month avg project timeline
- scales linearly with headcount

THE KİTCHEN

- 24 / 7 / 365 — agents don't sleep
- cost: API tokens only · no salary · no equity
- zero meetings · zero ego · zero burnout
- near 0% fixed overhead
- same project: days, not months
- scales with compute, not people
- memory management: 4× better than standard LLM
- token consumption: −40% vs unoptimized pipeline

COST DELTA	TİME DELTA	AVAİLABİLİTY	MEMORY	TOKEN OPT.
−95%	−75%	24/7	4×	−40%

The Flywheel.

ARBITRAGE → BUILD → MARKET → REVENUE → REINVEST ↺

- trading income funds new product development
- products marketed through autonomous content pipeline
- product revenue grows trading capital
- single input to start the loop: starting capital

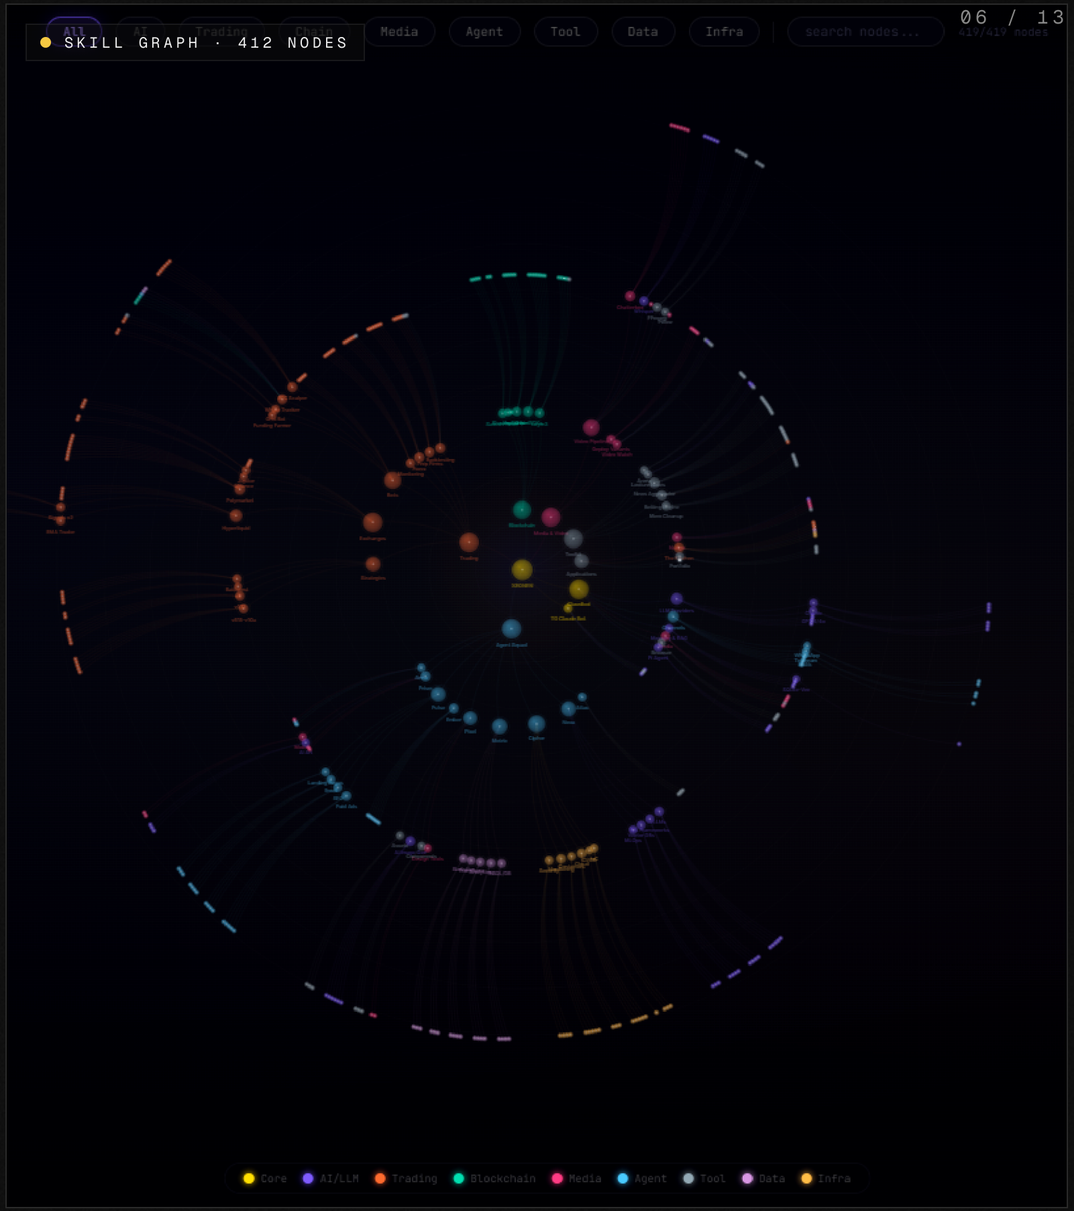
We don't trade.
Bots capture the spread.

- Funding Rate Arb · DEXes + prediction markets · market-neutral income
- Hunter · prediction market anomaly detection
- Bomber · multi-market spread capture
- optimal capital window: $20k – $30k per cycle
- system covers its own costs — break-even from month 1

no directional bets. no human decisions. net positive from month 1.

412 tools. Hours, not sprints.

- pain point detected → spec → code → deploy → market
- agent swarm ships while you sleep
- The Kitchen isn't sold — its output is



margin: near 100%. velocity: compounding.

Zero human touch. 200k+ views.

- news → script → voice → video → publish
- 100 videos produced · pipeline never stops
- @xeonenai · organic · zero ad spend

INSTAGRAM US — PAID EQUIVALENT

CPM (Reels/Feed) **$8 - $14** 200k views / post **≈ $1,600 - $2,800** monthly avoided **$6k - $11k**

agents build their own distribution moat.

11 agents.
9 in production. 2 in testing.

XEONEN	·	CTO — technical strategy & coordination
ATLAS	·	COO — ops & project management
PIXEL	·	UI / UX — frontend, design system
CIPHER	·	DevOps — infra, deployment, security
PRISM	·	Brand — visual identity, art direction
NOVA	·	AI / ML — model dev, GBrain
METRIC	·	Analytics — backtest & reporting
PULSE	·	Growth — acquisition & conversion
EMBER	·	Content — news pipeline, social
HUNTER	·	Counter-bot arbitrage — TESTING
BOMBER	·	Multi-market arbitrage — TESTING

Autonomous system.
Centralized stack.

- Agent memory in Redis · single node · any failure resets every agent cold
- Inference through OpenAI · rate limits · censorship · outages we can't control
- No decision audit trail · XEON's calls disappear into mutable logs · no proof

---

- PRISM manages real capital autonomously — unverifiable decisions are a structural risk
- a system designed to have no single points of failure was running on centralized infrastructure
- that's a contradiction — 0G fixes all three

What moved on-chain. And why.

- **Redis** → 0G Storage · agent state as content-addressed blobs · rootHash = crash-safe memory
- **OpenAI** → 0G Compute · NOVA routes inference through decentralized provider network · on-chain payment
- **Logs** → 0G DA · every XEON decision committed to DAEntrance contract · txHash = immutable proof

---

- 11 agents · 5 on 0G now · 6 on roadmap · full fleet by Milestone 7
- 0G Galileo V3 · chain 16602 · DAEntrance: 0xE75A073dA5bb7b0eC622170Fd268f35E675a957B
- live testnet · 10+ DA txHashes · 7+ storage rootHashes · all verifiable

Not a demo.
A running machine.

HUMAN SİGN-OFFS

00

npm live · Hyperliquid active · zero ad spend

Satoshi Proof: hackathon winner · canlı platform · satoshiproof.xyz · yatırım görüşmeleri aktif

ADHD Swiss Kit: agent-built · 3-day MVP · App Store pipeline ready · beta sürecinde

We integrated where it materially changes the system.

NOT ON 0G	REASON
ECHO distribution — Instagram / Reddit	Web2 platforms — no on-chain equivalent
LENS market scraping — raw signal ingestion	high volume, low verifiability need for v1
KURA QA monitoring — internal alerts	no external verifiability requirement
SOLA design specs — UI/UX artifacts	design files aren't decision-critical
CIPHER / FLUX deployments — DevOps	DA for rollback proofs — Milestone 4

on roadmap: ECHO content provenance · LENS intel storage · full treasury audit trail

Every channel.
One machine.

01 arbitrage — automated, reinvests itself, self-funded from month 1

02 subscription — apps, SaaS, web, API access · recurring revenue

03 delivery — finished product, client pays, The Kitchen stays

04 products — licensing, in-app, ads, every tech revenue model

revenue streams are independent. if one slows, others compound.
